

# RSAN: Residual Subtraction and Attention Network for Single Image Super-Resolution

Shuo Wei, Xin Sun, Haoran Zhao, Junyu Dong Ocean University of China

## Outline

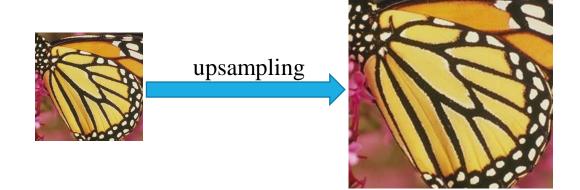

- Introduction
- Related work
- Proposed Method
- Experiments
- Conclusion

- Image super-resolution is a popular research direction in the computer vision area that generates high-resolution (HR) images from the low-resolution (LR) images.

Learning-based methods performances are still limited by two problems:

- ➤ most of the SISR methods neglect the importance among the feature map channels.
- ➤ they can not eliminate the redundant noises, making the output image be blurred.

## Deep CNN for SR:

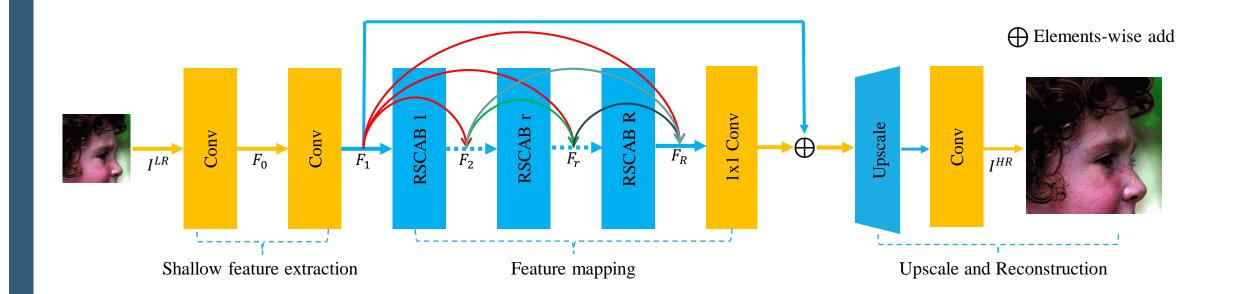

Single image super-resolution(SISR) tend to build end-to-end CNNs models, and learn the mapping function from LR to HR images. Such as SRCNN, VDSR, MemNet, EDSR, and etc.

### Attention in Deep Neural Networks

It has become a trend to apply attention mechanism to solve various computer tasks. There is a lot of work applying attention to convolutional neural networks. Such as SE, RCAN, SAN, and etc.

# Proposed Method

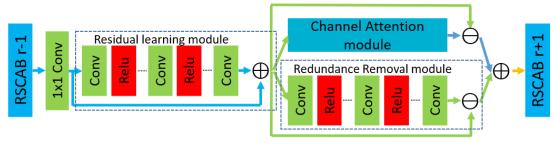

Residual Subtraction and Attention Network (RSAN) can be divided into four parts: shallow feature extraction, feature mapping, upscale and image reconstruction

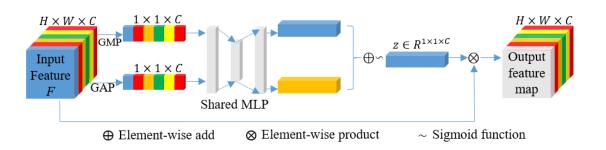

## Proposed Method

Residual Subtraction and Channel Attention Block
 RSCAB has three module: residual learning module, channel attention module and redundance removal module.

 $\bigoplus$  Elements add  $\bigoplus$  Elements subtract

#### Redundance Removal Module

The proposed redundance removal module is similar to residual learning module. The difference is that we use elements-wise subtraction to remove noise information.

#### Channel Attention Module

As shown in channel attention module, we first use global avg-pooling and max-pooling operations to generate avg-pooling and max-pooling features respectively. Then, we use multi-layer perceptron (MLP) to share weight. At last, we merge the output feature vectors via element-wise summation and product with input feature.

#### **Datasets**

- *Set5* 

- *Set14* 

- *B100* 

- *Urban100* 

TABLE I: Average PSNR/SSIM for scale factor x2 on datasets Set5, Set14, B100 and Urban100.

- We propose a residual subtraction and attention network for highly accurate SISR.
  Extensive experiments on benchmarks demonstrate its superiority over previous methods in terms of both quantitive and visual quality.
- We propose redundance removal module to subtract the noises in feature maps in order to enhance feature extraction capability.
- We introduce attention mechanism to identify the importance of different channels. It can amplify high-frequency information and avoid effectless channels.

# Thank you for your attention!
