Defogging

Defogging (or dehazing) is the task of removing the fog from an input image, aimed at reconstructing the same scene as if it were taken in good weather conditions.

- Easier with stereo images or a 3D reconstruction of the scene (e.g., LIDAR).
- More difficult with single images, especially in presence of severe fog.

Useful in:

- Autonomous driving.
- Security.

. . .

Improving photographs aesthetics.

Current approaches and problems

Classical methods [1]–[3] are often surpassed by DNNbased ones [4]–[8], using CNN or GANs. However, they often require paired data.

Problems

- Impossible to obtain the same identical scene with and without fog.
- Often, fog is inserted artificially in the training images.
 - Not precise since the exact depth map is needed.
 - Synthetic fog \neq real fog.

Totally unpaired approaches [9] show promising results in real fog conditions.

Problems

- Models often insert unwanted artifacts in the defogged images.
 - Due to the unrestricted nature of the unpaired training.

- Goal: use real foggy images but limit as much as possible the insertion of artifacts.
- ▶ We use a curriculum learning [10] strategy.
 - First, model is trained with paired data → artifact insertion highly penalized.
 - Then, real images are used \rightarrow high quality on real fog.
- Gradual transition between paired and unpaired data.
- Model can be seen as:
 - Paired training \rightarrow two different pix2pix models [11].
 - Unpaired training \rightarrow unique cycleGAN model [12].

 $\mathcal{L}_{\textit{adv}}^{\textit{defog}} = (D_{\textit{clear}}(c))^2 + (D_{\textit{clear}}(G_{\textit{defog}}(f)) - 1)^2 \qquad \mathcal{L}_{\textit{adv}}^{\textit{fog}} = (D_{\textit{fog}}(f))^2 + (D_{\textit{fog}}(G_{\textit{fog}}(c)) - 1)^2$

 $\mathcal{L}_{\textit{adv}}^{\textit{defog}} = (D_{\textit{clear}}(c))^2 + (D_{\textit{clear}}(G_{\textit{defog}}(f)) - 1)^2 \qquad \mathcal{L}_{\textit{adv}}^{\textit{fog}} = (D_{\textit{fog}}(f))^2 + (D_{\textit{fog}}(G_{\textit{fog}}(c)) - 1)^2$

HArD (Haze Artifact Detector)

Alma mater studiorum università di bologna

- No defogging metrics takes into account the presence of artifacts.
- Some metrics may be deceived by the presence of artifacts.
 - E.g. the metrics that counts the number of visible edges [13].
- How to detect the insertion of artifacts without the ground truth real images?
 - Idea: no edges in the foggy image \rightarrow no edges in the defogged image.
 - Find the regions in both images that contains edges and compare them.
 - Regions with edges in the defogged image and not in the foggy one \rightarrow artifacts.

Algorithm 1 HArD pseudocode

Require: f = original foggy image **Require:** d = defogged image

1: procedure HARD(f, d)

2:
$$f' \leftarrow \text{PREWITT}(f_{gray})$$

3:
$$d' \leftarrow \text{PREWITT}(d_{gray})$$

- 4: $f'_{smooth} \leftarrow \text{GAUSSIANFILTER}(f')$
- 5: $d'_{smooth} \leftarrow \text{GAUSSIANFILTER}(d')$

6:
$$f'_{scaled} \leftarrow \text{NORMALIZE}(f'_{smooth})$$

7:
$$f'_{sat} \leftarrow \tanh(\nu_{fog} \cdot f'_{scaled})$$

8:
$$d'_{scaled} \leftarrow \text{NORMALIZE}(d'_{smooth})$$

ヘロト ヘヨト ヘヨト ヘヨ

9:
$$d'_{\textit{sat}} \leftarrow \mathsf{tanh}(\nu_{\textit{defog}} \cdot d'_{\textit{scaled}})$$

10:
$$diff \leftarrow \min(0, d'_{scaled} - f'_{sat})$$

- 11: **return** MEAN(*diff*)
- 12: end procedure

Towards Artifact-Free Image Defogging

▶ ◀ Ē ▶ Ē ∽ ९ (~ January 13, 2021 12 / 18

Conclusions

- CurL-Defog: a curriculum learning-based novel defogging method.
- Artifacts minimized while maintaining good quality on real images.
- Effective defogging even with severe fog.
- A new referenceless metric (HArD) to numerically estimate the amount of defogging artifacts.

Future Work

- Combine the HArD metric with other defogging metrics (e.g. [13]) in order to penalize the insertion of artifacts.
- Use the HArD metric as a loss function during training.
- Scale the CurL-Defog method to HD images or videos.
