The most widely used NLP library in industry (3 yrs in a row)

Daily ~ 10K

Monthly ~ 350K

Scalable to a Cluster

Trainable & Tunable

**Fast Inference** 

Hardware Optimized

Community

- Reimplementing a Bi-LSTM-CNN-Char deep learning architecture on top of Apache Spark, we
  present a single trainable NER model that obtains new state-of-the-art results on seven public
  biomedical benchmarks.
- Delivering the first production-grade scalable NER model implementation.
- This includes improving BC4CHEMD to 93.72% (4.1% gain), Species800 to 80.91% (4.6% gain), and JNLPBA to 81.29% (5.2% gain).
- This model is freely available within a production-grade code base as part of the open-source Spark NLP library; can scale up for training and inference in any Spark cluster; has GPU support and libraries for popular programming languages such as Python, R, Scala and Java; and can be extended to support other human languages with no code changes.

A 28-year-old female with a history of gestational diabetes mellitus diagnosed eight years prior to presentation and subsequent type two diabetes mellitus (T2DM), one prior episode of HTG-induced pancreatitis three years prior to presentation, associated with an acute hepatitis, and obesity with a body mass index (BMI) of 33.5 kg/m2, presented with a oneweek history of polyuria, polydipsia, poor appetite, and vomiting. Two weeks prior to presentation, she was treated with a five-day course of amoxicillin for a respiratory tract infection. She was on metformin, glipizide, and dapagliflozin for T2DM and atorvastatin and gemfibrozil for HTG. She had been on dapagliflozin for six months at the time of presentation. Physical examination on presentation was significant for dry oral mucosa; significantly, her abdominal examination was benign with no tenderness, guarding, or rigidity. Pertinent laboratory findings on admission were: serum glucose 111 mg/dl, bicarbonate 18 mmol/l, anion gap 20, creatinine 0.4 mg/dL, triglycerides 508 mg/dL, total cholesterol 122 mg/dL, glycated hemoglobin ( HbA1c ) 10%, and venous pH 7.27. Serum lipase was normal at 43 U/L. Serum acetone levels could not be assessed as blood samples kept hemolyzing due to significant lipemia. The patient was initially admitted for starvation ketosis, as she reported poor oral intake for three days prior to admission. However, serum chemistry obtained six hours after presentation revealed her glucose was 186 mg/dL, the anion gap was still elevated at 21, serum bicarbonate was 16 mmol/L, triglyceride level peaked at 2050 mg/dL, and lipase was 52 U/L. The β-hydroxybutyrate level was obtained and found to be elevated at 5.29 mmol/L - the original sample was centrifuged and the chylomicron layer removed prior to analysis due to interference from turbidity caused by lipemia again.

The patient was prescribed 1 capsule of Advil for 5 days. He was seen by the endocrinology service and she was discharged on 40 units of insulin glargine at night, 12 units of insulin lispro with meals, and metformin 1000 mg two times a day. It was determined that all SGLT2 inhibitors should be discontinued indefinitely fro 3 months.

Color codes: FREQUENCY, DOSAGE, DURATION, DRUG, FORM, STRENGTH,

**Posology NER** 

No findings in urinary system, skin color is normal, brain CT and cranial checks are clear. Swollen fingers and eyes. Extensive stage small cell lung cancer. Chemotherapy with carboplatin and etoposide. Left scapular pain status post CT scan of the thorax.

Color codes: Organ, Organism\_subdivision, Organism\_substance, Pathological\_formation,

Anatomical\_system,

# Spark NLP

Spark is like a locomotive racing a bicycle. The bike will win if the load is light, it is quicker to accelerate and more agile, but with a heavy load the locomotive might take a while to get up to speed, but it's going to be faster in the end.

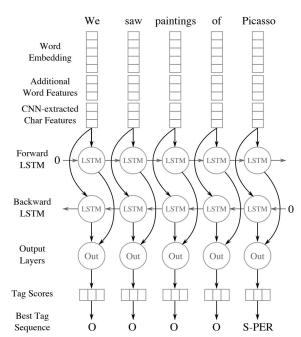

Faster inference

from sparknlp.base import LightPipeline
LightPipeline(someTrainedPipeline).annotate(someStringOrArray)

**LightPipelines** are Spark ML pipelines converted into a single machine but multithreaded task, becoming more than 10x times faster for smaller amounts of data (small is relative, but 50k sentences is roughly a good maximum).

### **NER Model Implementation in Spark NLP**

### **NER Model Implementation in Spark NLP**

#### **Char-CNN-BiLSTM**

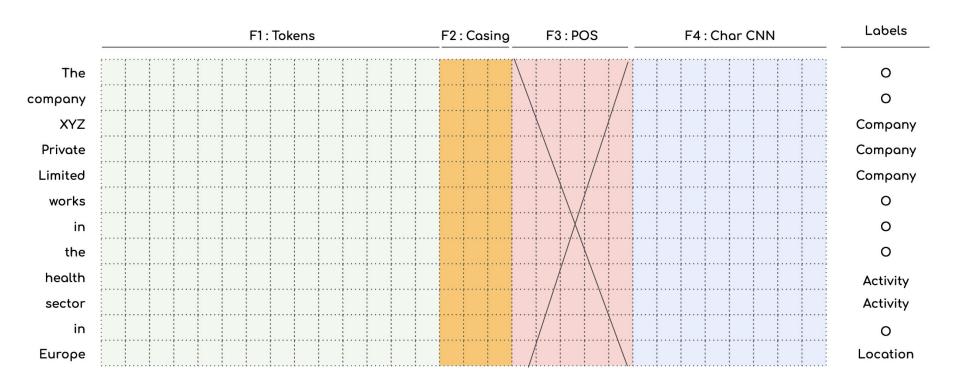

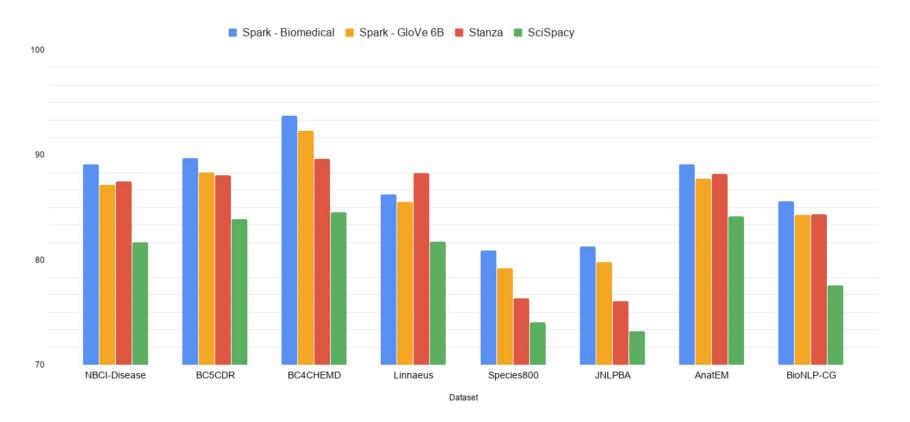

TABLE II: NER performance across different datasets in the biomedical domain. All scores reported are micro-averaged test F1 excluding O's. Stanza results are from the paper reported in Zhang et al. [2020], SciSpaCy results are from the scispacy-medium models reported in Neumann et al. [2019]. The official training and validation sets are merged and used for training and then the models are evaluated on the original test sets. For reproducibility purposes, we use the preprocessed versions of these datasets provided by Wang et al. [2019] and also used by Stanza. Spark-x prefix in the table indicates our implementation. Bold scores represent the best scores in the respective row.

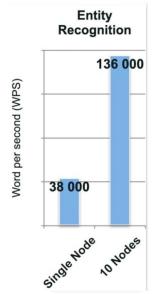

Dataset	Entities	Spark - Biomedical	Spark - GloVe 6B	Stanza	SciSpacy
NBCI-Disease	Disease	89.13	87.19	87.49	81.65
BC5CDR	Chemical, Disease	89.73	88.32	88.08	83.92
<b>BC4CHEMD</b>	Chemical	93.72	92.32	89.65	84.55
Linnaeus	Species	86.26	85.51	88.27	81.74
Species800	Species	80.91	79.22	76.35	74.06
JNLPBA	5 types in cellular	81.29	79.78	76.09	73.21
AnatEM	Anatomy	89.13	87.74	88.18	84.14
BioNLP13-CG	16 types in Cancer Genetics	85.58	84.3	84.34	77.6

Benchmarks on BioMedical NER Datasets

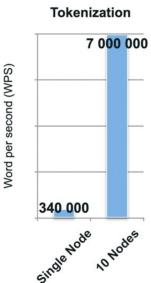

#### **TF in Keras vs TF in Apache Spark**

Table 3: Performance evaluation on biomedical NER datasets using the same BiLSTM-CNN-Char architecture in TensorFlow and Spark NLP under the same settings for each dataset. The Spark NLP implementation beats the same architecture 7 out of 8 times in terms of macro F1 score and is faster to train in half of the datasets (macro average F1 score, embeddings glove6B\_300d, lr 0.001, dropout 0.5, LSTM state size 200, epoch 10, batch size 128, optimizer Adam). Bold letters represent best results.

	Tensorflow 1.15 (Keras)		Spark	NLP
Dataset	time (sec)	macro-F1	time (sec)	macro-F1
BC5CDR-disease	409	0.840	336	0.858
BC5CDR-chem	438	0.848	367	0.894
<b>BC4CHEMD</b>	2954	0.890	2719	0.936
<b>NCBI-Disease</b>	312	0.882	269	0.883
JNLPBA	495	0.705	743	0.758
Species800	215	0.813	232	0.820
Linnaeus	709	0.787	730	0.759

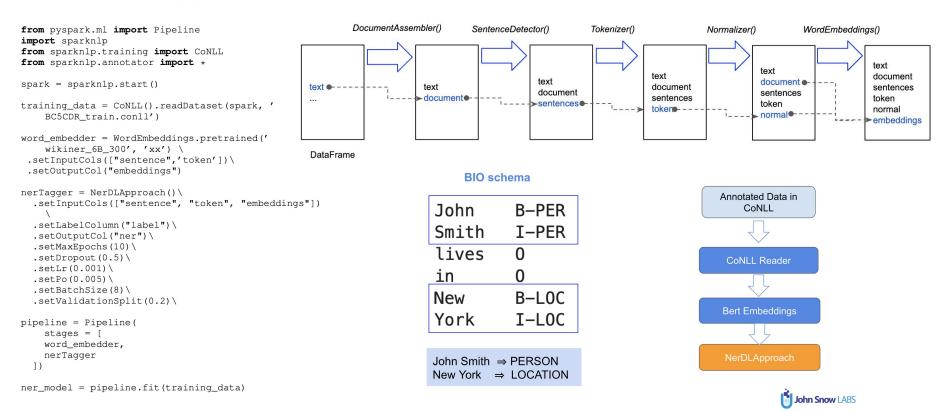

#### **Word Embeddings Coverage Ratio**

TABLE I: Word embeddings coverage ratios on biomedical datasets. Our domain specific embeddings have near-perfect word coverages. The average word coverage of our implementation of domain specific word embeddings (we call it Spark-Biomedical Embeddings in this study) is 99.5% and the average word coverage of Glove6B embeddings is 96.1% on the biomedical datasets used in this study)

Dataset	Spark-Biomedical Embeddings		Spark-Glove6B Embeddings		
	Training set	Test set	Training set	Test set	
NBCI-Disease	99.700	99.695	96.703	96.710	
BC5CDR	99.171	99.106	96.059	95.795	
BC4CHEMD	99.571	99.551	96.409	96.434	
Linnaeus	99.162	99.181	96.801	96.867	
Species800	99.350	99.345	95.909	96.258	
JNLPBA	99.530	99.496	92.566	92.690	
AnatEM	99.580	99.623	96.992	96.945	
BioNLP-CG	99.859	99.814	97.750	96.663
